The new feature I'm most excited about is the Cloud Import to Projects panel. This allows you to click a.tif or.psd file and the additions/changes to be applied instantaneously. Cloud Import to Projects also works for the aforementioned Clouds. It brings all the great capabilities of Lightroom to the Finder. Next is the new integrated converter—in fact, it should be one word. This is a big step for Adobe as it allows users to universally work on all files in the newest version of Adobe Photoshop. This is a feature that was already available from within Lightroom, but this new method is much more organized. You can install the free product from the Adobe website, and the entire interface is rendered in the native apps, so it might even function better than the desktop version does. But the free version is limited, and won't work with brand new files. Adobe's Lightroom is only getting bigger and more feature-rich. It's a very efficient application, but when I compare it to the competition (I particularly like Nikon View NX 2), Adobe's is still far behind. Lack of raw file support is still a problem. Lightroom 5 adheres to a workflow that favors very large collections. I've learned that I can't handle a big collection of between 30 and 40 images, no matter how good the results are. Lightroom 5 is also not yet capable of dealing with exif metadata. That's a big deal to me, because exif data is very important to me. I also don't like Adobe's proprietary.lightroom format, so I've had to convert all my files to something else. I've been using Lossless TIFFs, again, with minor downsides and works well for the most part. As for their proprietary.mov format, that's beyond me - I can't seem to make any headway on that. It is a little disappointing that Apple didn't include it with Final Cut Pro X, and it's even more disappointing that it isn't supported by the rival industry-standard AVI.
